Previously vaccinated with Nobisex DIP and a tepto vaccine (unknown which Lepto vaccine) on 7 Nov 2014. Miblemax was a bod dispensed at the same time but not given. Dog is aggressive so limited examination, normal for this dog 3 Dec 2015 presented as lethangic since the vaccine and not eating well. Wominity and dishrobes. 2 That a given 1.4 Dec 2015 continues to be very lethangic and off food, only eats when had fed. soft stools and orange in colour. Unable to examine conscious due to temperament so sedated. Radiographs showed a possible enlarged cardiac silhouette, liver enlarged. Ultrasound showed no gall badder or billiany enlargement and no signs of obstruction. The dog was sent home with Nutramed, Clawseptin and Metronidazole. IS Dec 2015 owner updated that dog happier to est, but seem tender under jaw and ears and passing orange dariness. 4.3 and 2016 og initially improved but has deteriorated again, no appetite, lethangy and pain around mouth. On examination the dog is still suggressive so examination limited, eyes unken and soluded. Clawseptin was tarted and to continue Zantac. 3 feb 2016 owner reports dog is unable to see very well, muscle loss at back of head and dog seems in pain in for limits, started on Metacam and Fortecker. 8 feb 2016 happers inne being on Metacam, pupils dilated and owner believes dog is now blind. Lethangic at home, eating well. Muscle loss around head and body, in consult room, bumple into thise, Predidaled started. The dog was presented the same day, limited examination due to aggression, but better as unable to see Vet. Abscert papillary light refuses in both eyes and seems certainly blind. Unable to examine ettan. Offered a neurological referral, but due to financial constraints owner declined. 15 Feb 2016 by dipter and more aller but continues to be blind. Continues on Prediminolen. Nothing Untert expected. Follow up 3 Mar 2016 - the dog is improving and is getting some sight back, improved demension; co	Rottweller	46	Nobbac L4 Supervisor for Injection for Open 1-1/N/M. Reported that in at 21 Jul 2016, had a grass end removed and was placed on antibiotics and Carprofen. On 27 Jul 2016, owner noticed an swelling on neck lymph node. On 1 Jul 2016, preserved with enlarged submandibular lymph node on one side, popileral also enlarged, given more antibiotics and Carprofen. Blood tests were performed and no abnormalities were detected. Not further information expected, follow up 12 Jul 2016. There was no change in his condition until the weekend when the neck lymph nodes relarged and the owner noted he has a little letharge. On 94 go 2016, a bloopy of lesions on the skin was carried out and also removed a popiliteal lymph node. The masses from the axilla and the stemur are consistent with plomast, the lymph node revealed a poorly differentiated sarcoma and presumed to be metastatic. Nothing further expected. On 12 Sep 2017, day executated with Nobrac L4 and was clinically well as time of vascination other than side in defendant list in the value (no treatment was required for this). On 17 Sep 2017, the owner brought the dog into the practice as been polyuric and polydipsic for a few days. On examination, slightly depressed and mucous membranes mildly congested—no treatment we given. On 18 Sep 2017, owner cancelled the recheck appointment and ultrasound and taken dog to another vests. On 55ep 2017, very brond the owner to find out how the dog was doing and the other vest performed an ultrasound which was unremarkable. Blood tests were also performed and showed hypercalcemia and the dog was admitted for further investigation. On 27 Sep 2017, dog was referred to a referral practice. There was mild increase in bronchovescicular sounds on thoracca suscultation but remainded of the general physical examination was unremarkable. Intallo bloods showed marked lonised hypercalcemia and IRIS stage IY acute bidney failure. Dog was anaesthetised and a CT of the chest and abdomer was performed. There were diffuse, evere ling changes with coalescing pulmonary nodules and infarction. Dog was diagnosed with metastatic neoplasia and the hypercalcemia was susumed to be parametergolistic. An oespication from the was placed while dog was under anaesthesia and was treated with intravenous fluid therapy and Pamidronate. The owner opted for evaluansals. Not further information respected.
